Application, Characteristics, Technical Data

Application

Gas pressure regulator (GDR), indirect-acting (operating with auxiliary power), for systems acc. to DVGW - work sheet G 491 (A) and G 600 (A) (TRGI).

Can be used as an equipment component on gas consumption facilities as defined in EC Directive EU/2016/426

Can be used for the gases defined in DVGW work sheet G 260 / G 262 and neutral non-aggressive gases. (other gases on request)

Characteristics

- Regulator with double-diaphragm system
- Model according to DIN EN 334 / 14382
- Integral pressure-tight model (IS)
- Gas pressure regulator with or without integrated SSV
- Compact and maintenance-friendly modular design
- SSV functional class, optionally A ($p_{ds\ u} + p_{ds\ o}$) or B ($p_{ds\ o}$)
- Open-air model

Type of model / options (see pages 22-23)

- With fine filter FF upstream of the regulator
- With pneumatic follow-up setpoint from I/P converter
- With built-in noise reduction
- Optionally with AV breather valve
- With SSV manual release
- With electric position indicator SSV "Closed" via inductive proximity initiator or via Reed contact
- With SSV electromagnetic remote release when power is applied or in case of power failure
- Oxygen model ($p_u \leq 10$ bar)
- Hydrogen model
- Coating with epoxy resin in RAL colors

Regulator models	R 70-10, R 70-20, R 70-20 (1:2), R 70-100
Required pressure difference for master regulator	500 mbar
Model	Integral pressure-tight (IS)
Max. allowable pressure PS	16 bar
Nominal width	RSP 254: DN 25, DN 50, DN 80, DN 100, DN 150, DN 200 RSP 255: DN 50, DN 80, DN 100
Actuator flange connection	DIN EN 1092 - flanges PN 16 ASME - B16.5 flanges Class 150 RF
Pipe connection type	G 1/4" or G 3/8" for threaded pipe connections to DIN EN ISO 8434-1 (DIN 2353)
Actuator material	Al cast alloy
Corrosivity category C1 to C5-I C5-M	DIN EN ISO 12944-2 without additional coatings an epoxy resin coating is recommended (see page23)
Regulator material	Al wrought alloy
Temperature range (operating/ambient temperature)	-20 °C to +60 °C
Function, strength, and tightness	DIN EN 334 and DIN EN 14382
Ex protection	The mechanical components of the device do not have any ignition sources of their own and are thus not covered by the scope of ATEX (2014/34/EU). Electrical components used at the device fulfil the ATEX requirements.

Design and function of the gas pressure regulator (GPR)

The gas pressure regulator RSP 254/255 has the function of keeping the outlet pressure of a regulation section downstream of a gas pressure regulator constant within specified limits, independently of changes in the gas tap or inlet pressure. The required auxiliary energy is obtained from the pressure gradient between the inlet pressure and outlet pressure of the gas pressure regulator. No external energy is required.

The GPR consists of a regulator with regulating unit, optionally with connected upstream fine filter and bypass valve, and an actuator. The control variable - the outlet pressure - is detected by a sensitive diaphragm in the regulating unit, which is part of a double-diaphragm system. The pneumatic amplifier working by the nozzle/baffle plate principle is actuated by the comparator formed by a double-diaphragm system. The bypass valve and possible changes in the setpoint spring can be used to affect the static amplification of the regulator and adjust it to the respective condition of a regulation section.

The outlet pressure is applied to the top side of the double diaphragm system in the regulating unit via a measurement line and converted into a pressure force which is compared with the set setpoint spring force that is used as defined command variable for the outlet pressure to be regulated. Any deviation from the control value is followed by a suitable proportional change in the spacing between nozzle and baffle plate, corresponding to a proportional change in the setting pressure. The valve opening required in each case for adjusting the outlet pressure actual value to the setpoint is effected by the setting pressure generated by the actuating drive of the actuator.

In the operating state, the inlet pressure taken at the inlet flows as auxiliary energy through the nozzle/baffle plate system and the bypass valve into the outlet pressure chamber, generating, depending on the position of the nozzle/baffle plate system, the setting pressure for the valve opening position required in each case against the bypass valve. The auxiliary energy gas then flows back to the outlet pressure network via the bypass valve.

In case of zero tap of the regulation section, the amplifier valve in the double-diaphragm system of the regulating unit will close tight, causing the closing pressure to be established.

Models with pneumatic follow-up setpoint inputs with 1:1 and 1:2 pressure conversions are available. Using an IP converter allows you to continuously set directly the required outlet pressure setpoint via, for example, a 4 to 20 mA signal. Moreover, by means of a setting spring, variable zero points can be suppressed.

Design and function of the safety shut-off valve (SSV) direct-acting

In case of inadmissible overpressure or lack of gas in the regulation section, the actuator of the safety shut-off valve arranged in the same housing on the inlet side will shut off the gas flow.

To this end, the outlet pressure to be monitored is passed on to the SSV control device via a separate measurement line. As a function of the change in pressure, the SSV diaphragm in the control device is raised or lowered. When the outlet pressure in the regulation section exceeds or falls below a certain response pressure, the switch socket connected to the SSV diaphragm will move to the corresponding disengaging position, the balls of the engaging mechanism will release the SSV screw spindle, and the closing spring will press the SSV valve plate against the valve seat. The SSV actuator shuts off the gas flow gas-tight.

The SSV can only be opened by hand and engaged in the open position. To do so, the outlet pressure at the measuring point must be lowered below the upper response pressure or raised above the lower response pressure by at least the re-engaging differential amount (Δp).

The SSV can, except where otherwise stipulated in specific national legislation, be used in either functional class A (with diaphragm rupture protection) or B (without diaphragm rupture protection).

There is also the option of using a remote display for the SSV position "CLOSED" and a manual and remote release when power is applied or in case of power failure.

Preferred installation position

The gas pressure regulators RSP 254 / 255 shall be installed in the pipeline preferably in horizontal position. For all nominal widths, the direction of flow is indicated by an arrow on the housing.

Only after consultation with
Medenus GmbH

Note: Observe the following documents in relation to installation, start-up, and maintenance:

- DVGW - work sheets G 491 and G 600

Determining the upper response pressure

Output pressure P_d	Upper response pressure $W_{ds\ o}$ *
≤ 200 mbar	$P_d + 100$ mbar
> 200 mbar to ≤ 800 mbar	$P_d \times 1.5$
> 800 mbar to $\leq 1,600$ mbar	$P_d \times 1.3$
$> 1,600$ mbar	$P_d + 500$ mbar
$> 3,000$ mbar	$P_d + 1000$ mbar

*) Standard spring

**)

If the control device is set up simultaneously for the upper and lower set pressure (functional class A) the difference between the setpoints of the upper and lower response pressure ($p_{ds\ o}$ and $p_{ds\ u}$) and the outlet pressure p_d must be at least " $\Delta p_{wo} + 10\%$ " or " $\Delta p_{wu} + 10\%$ ". Otherwise it cannot be guaranteed that the control device will re-engage.

		SSV measurement line	Breather line
DN 025	Connection* for: Tube 12 x 1.5 (thread G 3/8)	Connection* for: tube 12 x 1.5 (thread G 1/4)	
DN 050			
DN 080		Connection* for: tube 12 x 1.5 (thread G 3/8)	
DN 100			
DN 150			
DN 200			

AS 255: Connection of the functional line and breather lines

Nominal width	Setting device Setting pressure line / Return line	SSV control device direct-acting	
		SSV measurement line	Breather line
DN 050	Connection* for: Tube 12 x 1.5 (thread G 3/8)	Connection* for: tube 12 x 1.5 (thread G 1/4)	
DN 080		Connection* for: tube 12 x 1.5 (thread G 3/8)	
DN 100			

R 70: Connection of the functional line and breather lines

	Function / Breather line
R 70-10	Connection* for: Tube 12 x 1.5 (thread G 1/4)
R 70-20 (1:2)	
R 70-100	

Note: Observe the following documents in relation to installation, start-up, and maintenance:

DVGW - work sheets G 491 and G 600

Operating and Maintenance Instructions RSP 254 / 255

The gas pressure regulators RSP 254 / 255 shall be installed in the pipeline preferably in horizontal position. For all nominal widths, the direction of flow is indicated by an arrow on the housing.

*) Threaded pipe connections to DIN EN ISO 8434-1 (DIN 2353)

Connection example

**Gas pressure regulator RSP 254
with integrated SSV direct-acting
(optionally with pneumatic follow-up setpoint
I/P converter)**

Regulator R 70-10

Design of the gas pressure regulator RSP

Gas pressure regulator RSP 254 with integrated SSV indirect-acting

	Inlet pressure		Outlet pressure		Follow-up setpoint
	Set pressure		Atmosphere		SSV switching pressure

**Gas pressure regulator RSP 254
with integrated SSV direct-acting
(optionally with pneumatic follow-up setpoint
I/P converter)**

Types of models / Options

Fine filter FF

Fine filters FF are intended to separate gas impurities such as dust, rust, and other solids in gas-carrying lines at a defined point. They are used in the inlet pressure line between the actuator RSP and the regulator R70. Fine filters FF can be used for gases according to DVGW worksheet G 260/G 262 and for neutral non-aggressive gases. (other gases on request)

Noise reduction

The noise reduction made of metallic foam reduces noise in the gas pressure regulator produced by the flow rate by up to -15 dB (± 3 dB).

AV breather valve

The AV breather valve is used to secure the installation room against inadmissible escape of gas from diaphragm comparator compartments of safety shut-off valves. In case of a defect, the impermissible escape of gas into the surrounding atmosphere is limited to a maximum of 30l/h (air).

It also serves as a substitute for an expensive and complex installation of breather lines.

(Option not available for hydrogen version H₂)

Reed contact / inductive transmitter

Reed contacts and inductive transmitters are used to monitor the position (closed or open position) of the safety shut-off valve via remote display.

SSV manual and remote release

The direct-acting safety solenoid valve is used as electromagnetic remote release for closing the safety shut-off valve when power is applied or in case of power failure.

Epoxy resin coating in RAL colors

To protect the gas pressure regulator from external influences, starting from a corrosivity category C5-M we recommend an epoxy resin coating.

Types of models

Oxygen version O_2 ($p_u \leq 10$ bar)
 Hydrogen version H_2 (with helium leak test)

The Medenus gas pressure regulators are suitable for use with hydrogen as a medium up to a proportion of 100%.

Further information can be found in the special edition (10/2019) of gwf Gas+Energie and on our homepage at (www.medenus.de)

Design

Calculation of the required K_G value

$p_d / p_u > 0.5$
 Valve flow rate coefficient K_G at
 a subcritical pressure ratio

$$K_G = Q_n / \sqrt{p_d \cdot (p_u - p_d)}$$

$p_d / p_u \leq 0.5$
 Valve flow rate coefficient K_G at
 a supercritical pressure ratio

$$K_G = 2 \cdot Q_n / p_u$$

Note: All calculated pressures are absolute pressures.

Device selection

The device is selected on the basis of its K_G value from the table of flow rate coefficients (page 10)

Note: For the device design, a capacity reserve of 10% is recommended.

Example:

$p_{u \min}$ 5.0 bar / $p_{u \max}$ 8.0 bar
 $p_{d \min}$ 0.3 bar / $p_{d \max}$ 0.5 bar
 $Q_{n \min}$ 800 m³/h / $Q_{n \max}$ 1,500 m³/h

1.5 bar / 6 bar = 0.25 < 0.5

→ Supercritical pressure ratio
 $K_G = 2 \cdot 1500 / 6 = 500$ [m³/(h*bar)]

AS 254 DN 50 VS 32,5
 K_G value: 750 m³/(h*bar)

Properties of Gases

- for natural gas ($\rho_n = 0.83$ kg/m³; $t = 15^\circ\text{C}$)
- Δp = pressure difference from inlet pressure to outlet pressure
- Q_n = max. possible volume flow (determined using K_G values with a safety margin of 10%)
- f - natural gas conversion factor- L

Gas	f	Hs,n [kWh/m ³]	Gas	f	Hs,n [kWh/m ³]
Acetylene	0.84	16.25	Sewage gas	0.84	
Ammonia	1.04	4.83	Carbon monoxide	0.81	3.51
Butane	0.55	37.23	Carbon dioxide	0.65	-
Chlorine	0.51	-	Air	0.80	-
Landfill gas	approx. 0.80		Methane	1.08	11.06
Natural gas L	1.00	9.77	Propane	0.64	28.03
Natural gas H	1.03	11.45	Oxygen	0.76	-
Ethane	0.78	19.55	Sulphur dioxide	0.53	-
Ethylene	0.97	16.516	Nitrogen	0.81	-
Mine gas (30% CH ₄)		0.86	Hydrogen	3.04	13.43
Helium	2.15	-

THE MEDENUS PLUS

10 reasons for good business relations

1. Consultancy expertise and quality standards developed over decades
2. Broad and proven standard range of feedback controllers
3. Modern, fast and efficient production for series products and for individual orders
4. Customer-specific design of pressure regulators and vacuum regulators and special designs
5. Guaranteed deadline compliance with a delivery deadline guarantee
6. Fast response time in all matters
7. Sufficiently large parts storage for production and spare parts
8. Customer-specific theory & practice training courses
9. Modular design right across the entire product range to facilitate optimized handling of spare parts
10. 100% Made in Germany
